CareerConnect - AI Usage Log

Name: Ray Ntukanyagwe
Sprint: 2

Entry 1

Entry number: 1
Date: October 15, 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Task #4.1 — Viewing the Profile (#95): Profile Picture Cut Off by the Banner

Purpose of AI Use: Debugging a layout issue. Understand why the profile picture was only half visible on the profile page.

Chat Link or Prompt/Response: See Appendix, Entry 1.

AI-Suggested Content: While testing the profile page in the browser, the profile picture was cut in half by the banner image above it. Claude explained that the avatar was positioned to overlap the banner, but the banner was being drawn on top of it because of how the elements were stacked.

The suggested fix was to give the avatar its own stacking position (relative with a higher z-index) so it is always drawn above the banner.

Validation: Reloaded the profile page in the browser and confirmed the full profile picture was visible over the banner, both with an uploaded picture and with the initials fallback. Ran the tests, lint, and typecheck again before opening the pull request.

Decision: Accepted. The fix was small and solved the issue without changing the rest of the layout.

Reflection: Testing in the browser caught a visual bug that the unit tests did not. I learned how stacking order works when elements overlap, and that passing tests does not always mean the page looks right.

Responsible Person: Ray Ntukanyagwe

Entry 2

Entry number: 2
Date: October 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Development Environment: "Cannot find native binding" Error on macOS

Purpose of AI Use: Troubleshooting. Understand why the tests failed to start on my Mac after installing the project packages.

Chat Link or Prompt/Response: See Appendix, Entry 2.

AI-Suggested Content: After running npm ci, running the tests failed with a "Cannot find native binding" error. Claude explained that one of the build tools (rolldown) needs a package built specifically for the computer's processor, and that the version for Apple Silicon Macs was missing from the install.

The suggested fix was to install the missing macOS package without saving it to the project, then restore package-lock.json so the shared lock file would not change for the rest of the team.

Validation: Ran the tests again after the fix and they started and passed. Checked git status to make sure package-lock.json was unchanged before committing anything.

Decision: Accepted. I used the same steps again later whenever I reinstalled the packages after pulling new changes.

Reflection: I learned that some packages depend on the operating system and processor, and that it is important not to commit changes to shared files like package-lock.json that only fix a problem on my own machine.

Responsible Person: Ray Ntukanyagwe

Entry 3

Entry number: 3
Date: October 18, 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Task #4.3 — Education Section (#104): Handling Degrees Not in the Dropdown

Purpose of AI Use: Frontend design and data handling. Replace the free-text degree field with a dropdown without losing degrees that are not in the list.

Chat Link or Prompt/Response: See Appendix, Entry 3.

AI-Suggested Content: I asked for the degree field to be a dropdown (Bachelor's, Master's, etc.) with an "Other" option. Claude pointed out that the database only stores one degree value, so the form needed to combine the dropdown choice and the "Other" text into a single value before saving.

It also pointed out the reverse problem: when editing an entry whose degree is not in the list, the dropdown would not match anything. The fix was to reopen these entries with "Other" selected and the custom degree already filled in the text field.

Validation: Tested adding an entry with a listed degree and one with a custom degree, then edited both in the browser to check they reopened correctly. Unit tests were added for both cases.

Decision: Modified before use. The dropdown was my change request, and I kept the suggested handling for custom degrees after testing it.

Reflection: I learned that changing how a field is entered also affects how existing data is edited later, and that both directions need to be handled.

Responsible Person: Ray Ntukanyagwe

Entry 4

Entry number: 4
Date: October 18, 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Task #4.6 — Project Section (#107): Displaying Private Project Images

Purpose of AI Use: Backend integration and security. Understand how to display project images that are stored privately.

Chat Link or Prompt/Response: See Appendix, Entry 4.

AI-Suggested Content: The project images are stored in a private Supabase Storage bucket, so a normal public link would not work. Claude explained the difference between public and private buckets and suggested asking the server for a short-lived signed URL for each image instead.

It also suggested checking the file type (JPEG, PNG, or WebP) and size (5 MB maximum) before uploading, so invalid files are rejected right away instead of after the upload.

Validation: Uploaded images in the browser and confirmed they displayed as thumbnails, and that removing an image worked. Tried an unsupported file type to check that it was rejected with an error message.

Decision: Accepted. The signed URL approach matched how the backend functions were already designed.

Reflection: I learned why private files are shown through temporary signed URLs instead of public links, and how this keeps users' files from being accessible to anyone with the link.

Responsible Person: Ray Ntukanyagwe

Entry 5

Entry number: 5
Date: October 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Unit Testing — Profile Sections and Login/Signup Validation (#76)

Purpose of AI Use: Testing guidance. Write unit tests for my frontend work and add edge-case tests for the login and signup validation.

Chat Link or Prompt/Response: See Appendix, Entry 5.

AI-Suggested Content: Claude helped write tests with Vitest and React Testing Library. The tests act like a user by clicking buttons and typing in fields, while the server actions are mocked so the tests do not need the database.

It also suggested edge cases for the login and signup validation, such as empty fields, invalid emails, password rules, and mismatched passwords.

Validation: Read each test to make sure it matched the expected behaviour, then ran the tests locally. All tests passed, and the CI checks passed on each pull request.

Decision: Accepted after review. I kept the tests that matched our validation rules and features.

Reflection: I learned how mocking lets frontend tests run quickly without a database, and how edge-case tests can find problems that normal use would not show.

Responsible Person: Ray Ntukanyagwe

Entry 6

Entry number: 6
Date: October 24, 2026
AI tool/model: Claude (Anthropic), Claude Opus 5.5
Task ID/Title: Task #9.1 — Job Form Interface (#116): Job Status Limited by the Database

Purpose of AI Use: Database investigation. Check what the database allows before building the job posting form, and handle the status field from the issue checklist.

Chat Link or Prompt/Response: See Appendix, Entry 6.

AI-Suggested Content: Before writing the form, Claude checked the migration files and found that the job table already had a security policy allowing recruiters to create their own postings, so no new migration was needed to save jobs.

It also found that the database only accepts "open" or "closed" as a job status, while the issue asked for draft, published, and closed. Adding draft would need a migration and changes to job search so drafts stay hidden from job seekers. Instead, the form uses a Status dropdown where Published is saved as open.

Validation: Compared the form with the issue checklist and checked the status values against the database constraint. Ran the full test suite (945 tests passed), lint, and typecheck locally. I could not test it in the browser because my recruiter confirmation email did not arrive, so I asked the reviewer to test it with a recruiter account.

Decision: Modified before use. I kept Published and Closed for now and asked the issue author in Discord whether draft is needed this sprint.

Reflection: I learned to check what the database already supports before writing new code. It avoided an unnecessary migration and showed me early that one requirement could not be met

without a database change.

Responsible Person: Ray Ntukanyagwe

Appendix

Entry 1 — Profile Picture Cut Off (#95)

Prompt summary: The profile picture is cut in half by the banner on the profile page. Why, and how do I fix it?

Response summary: Claude explained that the banner was drawn on top of the overlapping avatar and suggested giving the avatar a higher stacking position (relative with a higher z-index).

Entry 2 — Native Binding Error on macOS

Prompt summary: The tests fail with "Cannot find native binding" after running npm ci. How do I fix it?

Response summary: Claude explained that the macOS package for rolldown was missing and gave the steps to install it without saving, then restore package-lock.json.

Entry 3 — Degrees Not in the Dropdown (#104)

Prompt summary: Change the degree field to a dropdown with an Other option.

Response summary: Claude updated the form to combine the dropdown and Other text into one saved value, and to reopen custom degrees as Other with the text filled in.

Entry 4 — Private Project Images (#107)

Prompt summary: How should project images from a private storage bucket be displayed?

Response summary: Claude explained public versus private buckets and suggested short-lived signed URLs, plus checking file type and size before upload.

Entry 5 — Unit Testing

Prompt summary: Help write unit tests for the profile sections and add edge-case tests for login and signup validation.

Response summary: Claude explained how to mock the server actions and provided tests covering normal use, validation errors, and server errors.

Entry 6 — Job Status Limited by the Database (#116)

Prompt summary: Check whether the database supports creating jobs, then add the status field from the issue checklist.

Response summary: Claude found the existing insert policy for recruiters and the open/closed status constraint, explained that draft would need a migration, and added a Published/Closed dropdown.
