CareerConnect - AI Usage Log

Name: Yousef Yousef

Sprint: 2

Entry 1

Entry number: 1

Date: 2026-10-08 to 2026-10-10

AI tool/model: Claude (Anthropic), claude.ai, Claude Design

Task ID/Title: UI mockups and AI feature research (recruiter candidate comparison, Jev)

Purpose of AI Use: Design and research. Explore a UI direction and identify the tool a teammate suggested for the TA's recruiter comparison feature.

Chat Link or Prompt/Response: See Appendix, Entry 1

AI-Suggested Content: A five-screen design canvas (job search, job details, applications, profile, recruiter dashboard) and a list of AI feature ideas. It first identified "Jev" as pgvector; after correction, it researched and confirmed Jev is TypeSafe AI's decision-only model, with its costs, limits and a tutorial on our stack.

Validation: Shared the mockup screenshots with the team in Discord. Rejected the pgvector answer and checked the Jev information against the linked sources. Access was later confirmed with a real test call (Entry 3).

Decision: Modified. The canvas was used as a reference only; the pgvector suggestion was rejected.

Reflection: The AI was wrong at first because Jev was newer than its training data. Asking it to research sources fixed this.

Responsible Person: Yousef Yousef

Entry 2

Entry number: 2

Date: 2026-10-15

AI tool/model: Claude (Anthropic), claude.ai

Task ID/Title: Recruiters can see applicant names (PR #154); US #5 acceptance tests; search bar fix (PR #155)

Purpose of AI Use: Debugging, database work and testing.

Chat Link or Prompt/Response: See Appendix, Entry 2

AI-Suggested Content: A secure helper function and policy so recruiters can read only their own applicants' profiles, and guidance on supabase db pull. It suggested trimming two unrelated functions from the generated migration. It traced a console warning on the search box to its default value and suggested a one-line fix.

Validation: Read the generated migration myself, trimmed it and committed only my change; real names then appeared on the recruiter page. Ran acceptance tests #143 to #145 and posted screenshots. After the fix, the warning stopped and Clear reset the box.

Decision: Modified (migration trimmed by hand).

Reflection: I learned how migration files relate to the live database and why each PR should contain only its own change.

Responsible Person: Yousef Yousef

Entry 3

Entry number: 3

Date: 2026-10-15

AI tool/model: Claude (Anthropic), claude.ai; Jev (TypeSafe AI) via Vercel AI Gateway

Task ID/Title: Jev access and a pilot on 7 test resumes

Purpose of AI Use: Research and validation before building the comparison feature.

Chat Link or Prompt/Response: See Appendix, Entry 3

AI-Suggested Content: A comparison of access options (recommended Vercel AI Gateway), Jev's documented weaknesses, and a pilot script scoring 7 invented resumes, including a prompt-injection resume and a keyword-stuffed one.

Validation: Made a successful test call, then ran the pilot twice: scores varied by 1 point or less; the injection resume scored 0 like its clean copy; the keyword-stuffed resume scored about 46 with low confidence (0.47 and 0.37). Part of my API key appeared in terminal output during setup; it is redacted.

Decision: Accepted with design changes: low confidence (below 0.5) is flagged for human review, and years of experience are computed in code.

Reflection: Testing the model myself gave real evidence and showed why a confidence flag is needed.

Responsible Person: Yousef Yousef

Entry 4

Entry number: 4

Date: 2026-10-17 to 2026-10-18

AI tool/model: Claude (Anthropic), claude.ai

Task ID/Title: Jev user story, tasks and acceptance tests (#163 to #173); client and scoring (PR #174), tables (PR #176), comparison logic (PR #175)

Purpose of AI Use: Planning and coding the recruiter AI comparison (User Story #19).

Chat Link or Prompt/Response: See Appendix, Entry 4

AI-Suggested Content: Issue text in the team format, then a server-only Jev client, weighted scoring in code with a confidence flag, the data sent to Jev (never names or emails), comparison logic, and two tables with recruiter-only security.

Validation: Adjusted issue numbers and dates before creating them. Tests passed on each PR (465). Catalin reviewed the tables; after his question, delete rights on evaluations were removed.

Decision: Modified. After discussing it with Catalin, company and school names are not sent to the model by default.

Reflection: Writing the issues first made the build clearer.

Responsible Person: Yousef Yousef

Entry 5

Entry number: 5

Date: 2026-10-18 to 2026-10-22

AI tool/model: Claude (Anthropic), claude.ai

Task ID/Title: Dashboard redesign (PR #180) and UI templates for the rest of the app

Purpose of AI Use: UI design and coding.

Chat Link or Prompt/Response: See Appendix, Entry 5

AI-Suggested Content: A real-data dashboard based on reference sites I provided, then a few templates for the rest of the app I shared with the frontend team.

Validation: Lint, typecheck and 480 tests passed, and the production build was checked by CI. Mockup widgets with no real data behind them were left out. I shared the templates with the frontend team for feedback.

Decision: Modified. The dashboard uses real data only, and the templates were shared as a starting point rather than final pages implemented.

Reflection: Giving the AI concrete reference sites and layout rules produced a much better result than a vague request.

Responsible Person: Yousef Yousef

Entry 6

Entry number: 6

Date: 2026-10-25

AI tool/model: Claude (Anthropic), claude.ai (Sonnet 5.5 and Opus 5.5)

Task ID/Title: Recruiter confirmation emails not arriving

Purpose of AI Use: Debugging.

Chat Link or Prompt/Response: See Appendix, Entry 6

AI-Suggested Content: Reviewed the signup code and database, tested the Concordia migration on a throwaway database, researched Supabase email limits, explained custom SMTP, gave SQL to confirm an account manually, and wrote a patch adding a check-your-email screen and a resend button. Some of its theories were unconfirmed.

Validation: The Supabase logs showed "email rate limit exceeded". I confirmed one teammate's account manually and verified the role. After setting up custom SMTP, the email appeared in the sender's Sent folder; delivery to Concordia inboxes is not yet confirmed.

Decision: Modified. Custom SMTP configured; the patch is not applied yet.

Reflection: The logs gave the real answer. Next time I would check them first.

Responsible Person: Yousef Yousef

Entry 7

Entry number: 7

Date: 2026-10-25

AI tool/model: Claude (Anthropic), claude.ai (Sonnet 5.5 and Opus 5.5)

Task ID/Title: Acceptance tests for US #13 (two new tests) and Jev #171 to #173

Purpose of AI Use: Testing.

Chat Link or Prompt/Response: See Appendix, Entry 7

AI-Suggested Content: Text for the two US #13 tests, SQL to create test applications for my own test accounts, and steps for each Jev test. It also noticed that the migration file in PR #210 was cut off.

Validation: Run on dev with real data: names and skill match ranking shown (100%, 80%); a second recruiter could not see the posting. #171: scores 74 and 40 with a per-requirement table. #172: a weak profile was flagged for review and statuses did not change. #173: the same profile scored 46 without and 50 with an injected instruction, with identical ratings.

Decision: Accepted. Screenshots posted and issues closed.

Reflection: Model confidence varies slightly between runs, which is why the human-review flag matters.

Responsible Person: Yousef Yousef

Appendix

Entry 1 - UI mockups and AI feature research (recruiter candidate comparison, Jev)

Prompt: Design the CareerConnect site in Claude Design as a prototype, following the usual layouts of job posting websites. Make it professional.

Response: Created a five-screen canvas in a navy and blue palette using invented sample data.

Prompt: It's Jev, not pgvector. Research which AI tool this matches.

Response: Corrected itself: Jev is TypeSafe AI's decision-only model; it explained how it works and its weaknesses (counting, dates).

Entry 2 - Recruiters can see applicant names (PR #154); US #5 acceptance tests; search bar fix (PR #155)

Prompt: The generated migration file also contains handle_new_user and rls_auto_enable. Should these be committed?

Response: No. They already exist on the remote database and are unrelated, so trim the file to only the new function and policy.

Prompt: A Base UI console warning appears on the search bar. What causes it?

Response: The input's default value changes after it loads; adding key={defaultQuery} fixes it.

Entry 3 - Jev access and a pilot on 7 test resumes

Prompt: Research where I can access Jev and what I need to build the recruiter feature.

Response: Recommended Vercel AI Gateway and advised running a small pilot, including a resume with injected instructions.

Prompt: Give me step-by-step instructions for the Vercel AI Gateway method.

Response: Explained how to create a gateway key and send one test call. The first calls returned 403 errors, which required adding a payment card and purchasing credits.

Prompt: Write a pilot that scores a few test resumes against sample requirements, including edge cases.

Response: Wrote a script scoring 7 invented resumes (strong, good, junior, unrelated, keyword-stuffed, messy dates, and one with an injected instruction) and computing a weighted score in code.

Entry 4 - Jev user story, tasks and acceptance tests (#163 to #173); client and scoring (PR #174), tables (PR #176), comparison logic (PR #175)

Prompt: Help me plan out the user story, tasks and acceptance tests so I can add them to GitHub.

Response: Provided templates for 1 user story, 7 tasks and 3 acceptance tests with Given/When/Then checklists.

Prompt: When are we going to implement it, and what is holding us back?

Response: Nothing blocked the code: it proposed building the Jev client and scoring logic first, then the comparison logic and tables, delivered as patches with tests.

Prompt: Should company and school names be sent to Jev? Real recruiters see them, but people are biased.

Response: Made it configurable, explained the trade-off between context and bias, and suggested testing both. The team later chose not to send them by default.

Prompt: Catalin asked why a recruiter would need to change evaluations. Do I need to change the database?

Response: Recruiters only need to create and re-score evaluations, not delete them, so the delete permission was removed.

Entry 5 - Dashboard redesign (PR #180) and UI templates for the rest of the app

Prompt: Use these sites as inspiration and keep familiar placements, with our own colors.

Response: Built a dashboard with real data only, leaving out mockup widgets with no data behind them.

Prompt: Create a few templates for the rest of the app in the same style.
Response: Produced templates for the remaining pages using the dashboard’s colors, font and shared header.

Entry 6 - Recruiter confirmation emails not arriving

Prompt: Recruiters using Concordia emails are not receiving the confirmation email. Find the cause and the fix.

Response: The code and database worked; the email step was failing. It recommended checking the logs and setting up custom SMTP.

Prompt: The login says the email is not confirmed, but no verification email arrived.

Response: The accounts exist and are waiting for confirmation, so they can be confirmed manually with a SQL update while the email issue is fixed.

Prompt: [Shared a screenshot of the Supabase Auth logs.]

Response: The logs show "429: email rate limit exceeded" on signup attempts, caused by the limit on Supabase's built-in email sender.

Prompt: Walk me through setting up custom SMTP.

Response: Explained how to create an app password and enter the SMTP settings in Supabase, then how to test with a new signup.

Entry 7 - Acceptance tests for US #13 (two new tests) and Jev #171 to #173

Prompt: Walk me through the acceptance tests I still need to do.

Response: Listed two new tests for US #13 (names and skill match ranking; a recruiter cannot see another recruiter's applicants) with ready-to-paste issue text, and the existing Jev tests #171 to #173.

Prompt: Explain exactly what I need to do to run and close #171 to #173.

Response: Gave steps on one posting and explained what each checklist item means.

Prompt: [Shared the comparison results before and after adding the injected instruction.]

Response: Pass: every per-requirement rating was identical and the score moved only from 46 to 50, far from the maximum.
